My Stack Decision (Rationale)

The stack I chose: Plain HTML and CSS, deployed on Netlify using drag-and-drop.

The alternatives I considered:

1. No-code builder (like Framer or Carrd) - I didn't choose this because I want full control over my portfolio.
2. Framework (like React) - I didn't choose this because it's too complex for my needs and I can't maintain it.

Why I chose my stack: I chose plain HTML/CSS on Netlify because it's completely free, very simple to set up, and will perfectly display my work. Since I'm a beginner, this stack is easy for me to learn and maintain with the help of AI. The AI can help me write the code, and Netlify makes deployment extremely easy with just a drag and drop.

Can I maintain this? Yes, absolutely. HTML and CSS are the basics of web development, and with AI assistance, I can easily make updates whenever I need to. Netlify handles all the hosting, so I don't have to worry about servers or complex configurations.

Backend question: Do I need a backend? **No, not yet.** My portfolio is static and doesn't need to store user data or have complex functionality at launch.

2. Live URL

My live website URL:

<https://famous-flan-57d021.netlify.app>

3. Screenshot

4. Confirmation of AI Workspace

I have loaded my Identity Kit, Case Studies, and Content Map into my AI workspace (Claude Project) to prepare for next week's build phase.
