### **My Automation Workflow: A 5-Step Process for Weekly AI Briefs**

I built a 5-step automation workflow that creates weekly AI/ML industry briefs. Here's exactly how each step works:

**Step 1 - GATHER:** I find 3-5 recent AI/ML articles from sources like tech news sites or research papers. I paste the article links or text into the system. The AI extracts only the key details: headline, source, a 2-line summary, and publish date. It flags anything it can't verify from the text as "[UNVERIFIED]" so I know to double-check later.

**Step 2 - SYNTHESIZE:** The AI reads through all the gathered articles and groups them into 2-4 themes. For each theme, it writes one sentence explaining why that topic matters, specifically for someone job-hunting in ML or banking-tech. The AI avoids fluff words like "dynamic" or "cutting-edge."

**Step 3 - DRAFT:** The AI turns the themes into a ~200-word plain-English brief. It uses short paragraphs and simple sentences. It follows a strict rule: no words like "passionate," "results-driven," or "dynamic" anywhere. The draft is ready to post but still needs a final check.

**Step 4 - REVIEW:** The AI re-reads the draft and flags three things: (a) any claim not traceable back to the original gathered list, (b) anything vague or generic, and (c) one thing to cut. It's brutally honest—no polite feedback. This catches problems I might miss.

**Step 5 - FORMAT:** The AI applies the fixes from the review and outputs the final brief with a one-line title. It's now ready to post.

### **Why I Built It and What I Learned:**

This automation saves me about 18-20 minutes per brief compared to doing everything manually. The setup took about 15 minutes—writing and saving the instructions for the AI. After that, each brief takes roughly 12-14 minutes instead of 30-35 minutes.

### **Important Lessons I Learned:**

1. **The review step is critical.** Every run in my test batch had at least one issue that only Step 4 caught—usually unverified claims or vague language.
2. **I still need to check the output.** The AI flags things as "[UNVERIFIED]" but I must verify them against the original sources before publishing.
3. **Sources can disagree.** In one run, two different articles had conflicting dates for the same EU regulation. I had to pick the most authoritative source (the official EU website, not a blog).
4. **Numbers need extra care.** In 2 out of 5 test runs, numbers came from reports citing other reports (secondhand citations). I had to either chase the original source or drop the number.

### **The Bottom Line:**

I built this workflow so I can consistently produce high-quality briefs without spending hours on manual writing and editing. The AI handles the heavy lifting (drafting, synthesizing, reviewing), but I stay in control as the human reviewer. I check every fact, resolve conflicts, and make the final call on what to publish. It's a real partnership—AI assists, but I own the result

My automation workflow is a 5-step process I built to create weekly AI news briefs. Here's how it works:

**Step 1 - Gather:** I find 3-5 recent AI/ML articles and paste them into my tool.

**Step 2 - Synthesize:** The AI groups them into 2-4 themes and explains why each matters.

**Step 3 - Draft:** The AI writes a ~200-word brief about the themes.

**Step 4 - Review:** The AI checks for mistakes, vague claims, and anything not supported by the sources.

**Step 5 - Format:** The AI fixes the issues and outputs a final, ready-to-post brief.

**Why I built it:** This saves me about 20 minutes per brief compared to doing everything manually. The AI handles the writing and editing, but I always check the final output before publishing. I also have to verify any claims marked [UNVERIFIED] against the original sources.
